

RECENT PROJECTS/*STREETS/PARKING LOTS/BIKE PATHS*

The majority of transportation system projects listed below include rehabilitation to existing public facilities: downtown streets, residential streets, rural roads, parking lots, bike paths, and some highways. These projects incorporate a variety of repair methods depending on the condition, type of service, and available budget. Our scope of work typically includes geometric layout, drainage evaluation and design, drivability evaluation, consideration of aesthetics, and interfacing with adjacent improvements. Often special consideration is given to construction scheduling and/or staging requirements to reduce the impact to adjacent businesses and residences. New transportation system improvements are typically associated with site development projects and are not listed separately in this section.

Project	Client or Owner	Size	Scope *
